

terraform-aws-practice — Current Architecture & Modules

The complete module inventory of the AWS practice project (data platform + cert blueprint).

terraform-aws-practice — Current Architecture (all modules)

one modular Terraform project · each module toggled with enable_*

Regenerated whenever a new module/service is added. Data platform is on by default; the VPC blueprint modules are off until enabled.

Module inventory (12 modules)

Module	Purpose	Blueprint step
s3_bucket	object storage / data lake (bronze)	N
lambda_function	order-processor (S3-triggered) -> DynamoDB	Y
dynamodb_table	Orders table (live state)	O
glue_etl	Spark ETL bronze -> silver Parquet	batch
analytics	Glue Catalog + Athena (SQL on S3)	analytics
vpc	VPC, subnets, IGW, NAT, route tables, endpoints	F-L
security_groups	5 tiered firewalls (ALB/App/Bastion/DB/Lambda)	M
rds	Multi-AZ-capable DB in private subnets	P
ec2_asg	launch template + ASG + ALB + target group	Q-U
messaging	SNS topic + SQS queue + DLQ + subscription	V-X
iam	dedicated EC2 + Lambda roles	D-E
cloudwatch	metric alarms + notification topic	Z

How to use

- Every module is toggled with an enable_* variable (data platform on by default; VPC blueprint off).
- Build the cert environment: terraform apply -var-file=dev.tfvars (see EXECUTION_GUIDE).
- The diagram is regenerated from docs/make_architecture_diagram.py whenever a module is added.
- Repo: github.com/pramodbalamuri-commits/terraform-aws-practice (BLUEPRINT.md + EXECUTION_GUIDE.md).
